Functional Features Included in the Solution

Phase 5: Project Development Phase

1. Feature Inventory

Features are counted as implemented only when their behaviour is present in the source and can be demonstrated. The table lists twelve functional features with their main source location.

No.	Feature	Main source
1	Public landing page with sample preview and call-to-action buttons	pages/LandingPage.jsx
2	Sign-in, sign-up and one-click demo sign-in	LoginPage, SignUpPage, AuthContext
3	Dashboard with trip statistics, active itineraries and curated inspiration	pages/DashboardPage.jsx
4	Five-step trip wizard with per-step validation	pages/TripWizardPage.jsx
5	AI itinerary generation (Gemini or OpenAI) with heuristic fallback	ai_service.py
6	Day-wise itinerary with morning, afternoon and evening activities	ItineraryViewPage, DayTimeline
7	Live budget summary and over-budget warnings	budget_service.py, BudgetSummary
8	Inline activity editing, deletion and day regeneration	TripEditPage, ActivityCard
9	Saved Trips with search and travel-style filter	pages/SavedTripsPage.jsx
10	Profile with default preferences, and settings with diagnostics and demo reset	ProfilePage, SettingsPage
11	Print / Save as PDF and printable HTML export	exportPdf.js, export.py
12	Health endpoint and custom 404 page	health.py, NotFoundPage

2. Feature Notes

Trip input

The wizard collects destination, dates, traveller type and count, budget and currency (USD, EUR, GBP or JPY), style, pace, nine interest tags, dietary and accessibility notes, accommodation preference and special requests.

AI generation and fallback

The AI feature creates a planning draft. It is not a guarantee that every activity, travel time or cost is correct. The fallback generators keep the application usable offline.

Budget

The budget feature compares estimated spending with the target. It is based on generated estimates, not on live prices.

Editing and regeneration

Day regeneration in the current version transforms the existing activities into alternative entries. A model-backed regeneration is listed as future work.

Persistence

Signed-in users with a configured Supabase project can read their saved trips from the database. Demo-mode data is stored in the browser and in server memory.

Health check

The /health endpoint reports status, version, environment and whether Supabase and an AI provider are configured. It does not itself prove that generation will succeed.

3. Feature Acceptance Checklist

- The wizard blocks invalid steps and accepts valid input.
- Generation returns days, activities and a budget summary.

- An over-budget plan shows a warning.
- Edits change the activity list and the budget total.
- A deleted trip no longer appears in Saved Trips.
- Search and style filter narrow the list correctly.
- The print preview shows every day without navigation or buttons.
- The 404 page appears for an unknown address.

No pass percentage is asserted here. Record results from actual test runs before using this inventory as an acceptance report.
