Project Communication

Phase 8: Project Demonstration

1. Purpose of Communication

Communication should help a reviewer understand the user problem, what the application really does, how the main workflow operates and which limitations remain. The explanation should be concise and consistent across the report, the live demonstration and any slides.

2. Short Project Pitch

trvale-book helps travellers turn their destination, dates and budget into a structured, editable itinerary. A five-step wizard feeds a FastAPI backend that uses Gemini or OpenAI, with a built-in fallback, and a live budget summary shows whether the plan fits. Users can save, search, edit and print their trips, and anyone can try the whole application in demo mode.

3. Audience-Specific Emphasis

For a general audience

Focus on the journey: sign in, answer five short steps, receive a day-wise plan, check the budget, adjust it and print it. Avoid framework terms unless asked.

For a technical reviewer

Explain the frontend and API boundary, the Pydantic validation, the prompt and JSON handling, the fallback design, the budget service, the Supabase schema with row-level security, and the deployment on Vercel and Render. Show where credentials are configured and how errors are handled.

For an evaluator

Describe the problem, objectives, working features, test evidence, constraints and future work, and clearly distinguish implemented features from planned ones.

4. Claims to Avoid

- Do not claim live prices, ratings or availability.
- Do not claim booking or payment capability.
- Do not present fallback or demo output as live AI output.
- Do not quote latency, accuracy or satisfaction figures without measurements.
- Do not say every test passed unless the results are recorded.

5. Recommended Speaking Order

1. Introduce the project and the planning problem.
2. Show the landing page and the one-click demo sign-in.
3. Walk through the five wizard steps and generate the itinerary.
4. Review the day tabs and the budget summary.
5. Edit an activity and show the budget change.
6. Show Saved Trips search and filter.
7. Show the print preview.
8. Summarize the architecture, limitations and future improvements.

6. Communication Quality

Use a readable zoom level, avoid rushing through long outputs and explain what each action proves. If a live service fails during recording, say so honestly and use a prepared screenshot only as supporting evidence.
