Demonstration of Proposed Features

Phase 8: Project Demonstration

1. Demonstration Goal

The demonstration should prove that the core journey is connected and understandable. It should show a user entering data, generating a plan, reviewing the budget, making changes, saving and printing, and not merely display screenshots in sequence.

2. Feature Walkthrough

Landing and sign-in

Begin on the landing page, point out the hero, the sample preview and the three-step explanation, then use the one-click demo sign-in and show the demo banner.

Dashboard

Show the trip statistics, the active itineraries and the curated inspiration cards, and start a new plan.

Trip wizard

Show the five steps. Demonstrate one validation message, then use the test case: Kyoto, Japan; 10 to 13 November 2026 (4 days); 2 travellers (couple); budget 3,200 USD; balanced style; moderate pace; interests Culture and Heritage, Food and Culinary, Sightseeing; dietary note "Pescatarian, loves matcha and ramen".

Itinerary and budget

Generate the plan, open the day tabs, and explain the morning, afternoon and evening structure. Show the budget summary and explain that costs are estimates.

Edit and regenerate

Open the edit page, change or remove an activity, regenerate a day, and show that the budget total updates.

Saved Trips

Search by destination, filter by travel style, open a trip and, if needed, delete a disposable test trip after confirming the dialog.

Profile and settings

Show the saved defaults and the diagnostics on the settings page; mention that demo data can be reset there.

Print or save as PDF

Use Print / PDF, show the preview with the navigation hidden and every day included.

3. Evidence to Capture

- Landing page and login page.
- Dashboard.
- Wizard step 1 and the final review step.
- Generated itinerary with the budget summary.
- Edit page.
- Saved Trips with search or filter applied.
- Profile and settings pages.
- Print preview.
- 404 page and, if a backend is deployed, the /health response.

4. Demonstration Integrity

Only show capabilities that are actually working. If a feature is unavailable, label it as planned. Do not display environment files, API keys or personal browser content during the recording.

5. Post-Demonstration Tasks

Review the recording for audio, readability and accidental secret exposure. Upload it, set suitable access permissions, and test the link in a separate browser session before adding it to the submission.
