Project Demo Planning

Phase 8: Project Demonstration

1. Preparation Strategy

A reliable demonstration depends on preparing the environment and the sample data before recording. Test the deployed site immediately before recording, including the full generation flow, and, if a backend is deployed, its health endpoint.

2. Suggested Run of Show

Segment	Time	Content
Opening	30 s	Introduce trvale-book and the planning problem.
Landing and sign-in	30 s	Show the landing page and use the demo sign-in.
Wizard	75 s	Walk through the five steps with the Kyoto test case.
Itinerary and budget	75 s	Show day tabs, activities and the budget summary; mention that costs are estimates.
Edit and regenerate	45 s	Change an activity, regenerate a day and show the budget update.
Saved Trips	30 s	Search, filter and open a trip.
Print and close	45 s	Show the print preview, then summarize architecture, limitations and future work.

3. Technical Checklist

- Confirm the Vercel site loads and the demo sign-in works.
- Confirm whether the backend is reachable; know whether the demo will run with the backend or in fallback mode.
- Prepare the test case and know the expected sections.
- Check audio input and screen-recording resolution.
- Close notifications and unrelated windows.
- Ensure no secrets are visible.
- Keep screenshots as backup evidence.

4. Contingency Plan

If the AI provider or backend is unavailable, the application falls back to its local generator. Say so honestly if this happens during the demonstration. Do not present a failed action as a success; retry later if a live provider run is required.

5. After Recording

Watch the complete recording once. Confirm that audio is audible, cursor actions are visible, text can be read and no credentials are exposed. Upload the final recording and test its link in a separate browser session.
