Team Involvement in Demonstration

Phase 8: Project Demonstration

1. Purpose

This document describes how responsibilities can be organized during the demonstration. It should reflect actual participation. The supplied materials do not contain a verified contribution breakdown for team members, so no names or roles are asserted here.

2. Single-Presenter Option

If the submission is individual, one presenter introduces the problem, demonstrates the application, explains the architecture and summarizes limitations, and also prepares the screenshots and checks the final video link. The documentation should say that a single presenter delivered the demonstration.

3. Multi-Presenter Option

If several contributors are officially part of the submission, divide the work into roles: a presenter for the problem and user journey, a technical presenter for the API, AI service, budget logic and database, and an evidence coordinator for screenshots, test results and links. Assign names only after confirming real responsibilities.

4. Suggested Responsibilities

Role	Responsibility	Name
Application walkthrough	Landing, sign-in, wizard, itinerary, budget, edit, saved trips and print in the planned order	To be confirmed
Technical explanation	Frontend/API boundary, validation, AI provider and fallback, budget service, Supabase schema and row-level security, deployment	To be confirmed
Evidence and submission	Screenshots, test results, working links and absence of secrets	To be confirmed

5. Coordination Checklist

- Confirm the names and actual contributions of participants.
- Agree on the demo order and transitions.
- Avoid explaining the same feature twice.
- Prepare a fallback screenshot in case a live service fails.
- Make sure every presenter understands the limitations and can answer questions.

6. Integrity Note

This template intentionally avoids asserting that a team meeting, rehearsal or role assignment has already happened. Update it with factual details once the final presenter arrangement is confirmed.
